

Welcome to MaxEnterprise

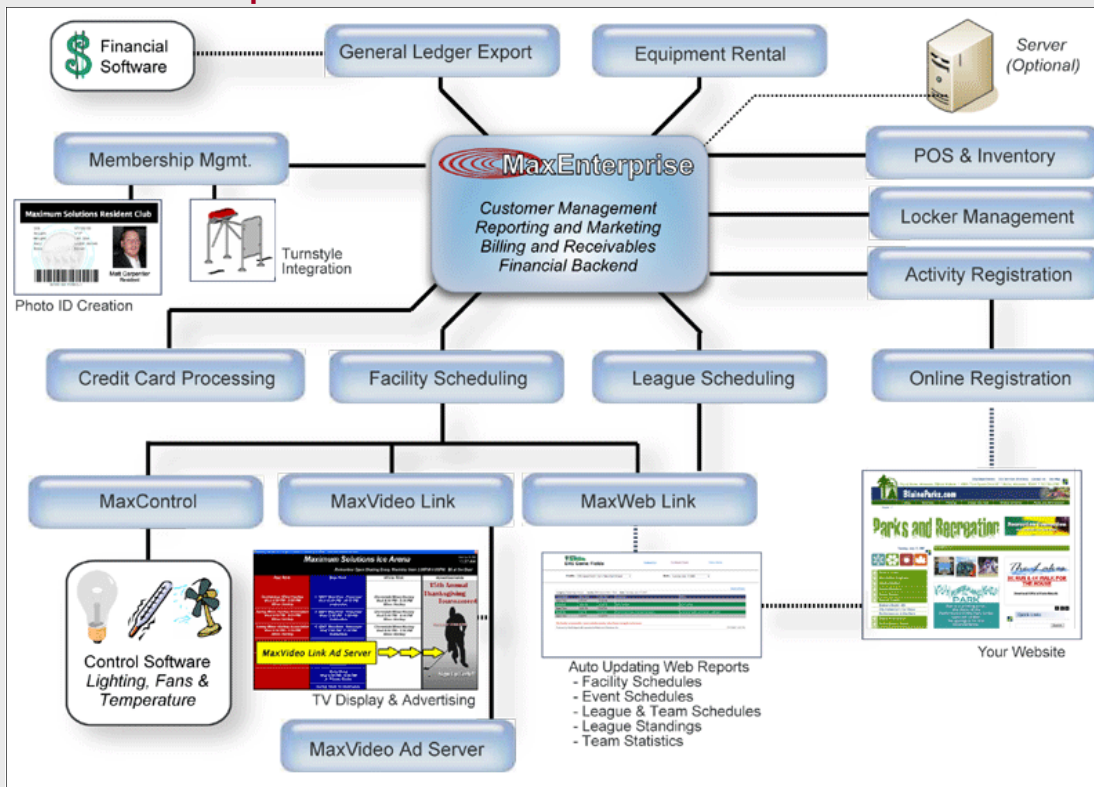

Web-Enabled Desktop/Client/Server Recreation Management Software

Handling the every changing customer demands and headaches you put up with seem endless: managing courses and offerings, processing paper enrollments, trying to find and identify missing forms, tracking and reporting data in real time, dealing with irate customers when they show up thinking they can sign up for a class that's already filled, double booking a rental facility and possibly losing business. The list could go on and on. Many organizations and departments even budget for yearly losses because of all the hours spent on managing an ineffective system! MaxEnterprise was designed for just this reason.

MaxEnterprise is a powerful suite of integrated desktop applications for the recreation industry that will improve the overall productivity and profitability of any organization. Keep track of all your administrative functions with one of the industry's most feature rich, easy to use software's on the market. This exciting offering streamlines your most common functions including facility reservations, activity registrations, membership management, league scheduling, point of sale, inventory, and all the financial and administrative reporting necessary to effectively manage your organization. Tracking pertinent customer information for future target marketing efforts will yield increases in revenue. We handle your administrative software and tracking needs while allowing you to do what you do best in providing exceptional service to your customers.

How MaxEnterprise Works...

Integrated applications – All customers and financials are shared by a common database. When a program is created in Activity Registration the corresponding facilities are automatically booked out in Facility Reservation.

No multiple installations of separate programs, no data import – all applications are contained within the MaxEnterprise system. Your organization's license file determines how many of the available applications are included.

User Security access by feature and/or complex– after creating logins and passwords and assigning employees to Feature Access groups, users will only have access to specific features (i.e., scheduling but not receivables, or activity registration but not inventory, etc.) or specific Complexes (i.e., Recreation Center but not Ice Arena, or Middle School but not High School, etc.)

Customer Management - Track companies, families, individuals, and employees records. Track things such as contact info, demographic info, health a medical information, as well as recording a history on everything they are involved with. Create and pull custom email and mail lists based on a number of different factors including past attendance, customer information, membership purchases, facility rentals and much more.

Extremely Flexible Billing - Taking payments and generating invoices with a breeze. MaxEnterprise is also sophisticated enough to allow you to alter invoices that were already created, combine multiple invoices into one, setting customer payments up on recurring billing cycles, and much more!

Reporting - Over 150 administrative reports are available within MaxEnterprise.

Application Offerings
